Data Structure

DS is a way to store, organize and manage data in a computer to store and access data efficiently

example Array, linked list, stacks, Queue, Tree, Graph, Hash table.

Best way to choose DS for prb

1. Analyse the required operation.
2. estimate time and space needed for operation.
3. Choose correct DS to support operation efficiently

Type of DS

1) Primitive DS

Basic Data type like int, float, double, char, bool

2) Non-Primitive DS

created using primitive type (e.g. Array, linked list, tree, graph, queue, stack etc..)

Further Divided into

1) Linear Data Structure

Data arranged in sequence (e.g. Array, linked list, stack, queue)

2) Non-Linear Data structure

Data arranged in hierarchy or in network (e.g. Tree, Graph).

Operation of DS

- 1) Traversal - accessing each data item exactly once to process it
- 2) Searching - Find location of data
- 3) Insertion - Add new data (Beginning, end, desire position)
- 4) Deletion - remove data (Beginning, end, any position)
- 5) Sorting - data items in ascending / descending
- 6) Merging - combining two list into one list

Abstract Data type (ADT) | Information Hiding.

In Abstract Data type it only show what data is? and what operation is performed? not how actually it was implemented.

- (eq) (i) int \rightarrow addition, subtraction, gcd, sqrt
- (ii) Real number \rightarrow represent by decimal, support arithmetic operation and ordering
- (iii) Book ADT \rightarrow contain name, author, ISBN, compare difficulty, search etc..

Advantage of ADT

- i) can change internal data structure without changing whole program.
- (ii) easy to update and maintain
- iii) reduce rewriting code & less error-prone.

Array in Data Structure

Array is fixed size ~~are~~ sequenced collection of data items of same data type.

\rightarrow It can be accessed through index \Rightarrow arrayname[index]

type \rightarrow 1-D Array

\rightarrow 2-D Array

\rightarrow Multi-dimensional Array

1-D array

4	6	8	...	20
0	1	2	...	n

2-D array

	0	1	2	...	n
0	(0)(0) 1	(0)(1) 2	(0)(2) 3	...	
1	(1)(0) 4	(1)(1) 5	(1)(2) 6	...	

row-major \rightarrow data stored row wise in memory

1	2	3	4	5	6
---	---	---	---	---	---	-----	-----

column-major \rightarrow data stored column wise in memory

1	4	2	5	3	6
---	---	---	---	---	---	-----	-----

insert, delete, find, all operation done through traversal using loop

multi-dimension array \rightarrow more than 2 rows (or) column (or) both
